

WCMS Exam Study Pack

Single PDF containing yellow-marked source questions and answers, plus the most important non-yellow questions for exam revision.

Coverage Summary

Unit	Questions parsed	Yellow-marked Q&A;	Extra important selected
Unit 1	33	12	6
Unit 2	45	7	6
Unit 3	33	8	6
Unit 4	57	6	6

Selection note: Yellow-marked questions come from PDF highlight annotations. Extra important questions exclude all yellow-marked blocks and are ranked by long-answer value, syllabus centrality, comparison/process framing, and answer breadth.

Exam Priority Analysis

These are non-yellow questions ranked for exam revision. The score favors long-answer coverage, repeated core topics, comparison/process questions, and explicit mark framing.

Rank	Question	Why important
1	Unit 1 - Q14: Explain steps involved in the audio editing process.(4)	long-answer coverage; explicit exam-mark framing; common exam command words; process/steps question
2	Unit 1 - Q9: Explain various audio file formats.(4/6)	long-answer coverage; explicit exam-mark framing; common exam command words; broad answer scope
3	Unit 1 - Q12: Explain needs and general guidelines for content development. (4)	long-answer coverage; explicit exam-mark framing; common exam command words; broad answer scope
4	Unit 1 - Q10: Write a note on content tools. (4/6)	long-answer coverage; explicit exam-mark framing; broad answer scope
5	Unit 1 - Q3: What are the types of content management system?	common exam command words; core topic: cms; core topic: wcms
6	Unit 1 - Q5: What are the types of WCMS?	common exam command words; core topic: cms; core topic: wcms
7	Unit 2 - Q18: Explain the different steps are involved in creating multilingual content in Word Press.(6)	long-answer coverage; explicit exam-mark framing; common exam command words; broad answer scope
8	Unit 2 - Q13: Explain the key features of any three screen casting tools (6)	long-answer coverage; explicit exam-mark framing; common exam command words; broad answer scope
9	Unit 2 - Q9: What are the different steps are involved in creating a wiki. (6)	long-answer coverage; explicit exam-mark framing; common exam command words; broad answer scope
10	Unit 2 - Q7: Explain the different examples of presentation software that are commonly used in conjunction with WCMS platforms. (6)	long-answer coverage; explicit exam-mark framing; common exam command words; broad answer scope
11	Unit 2 - Q17: Write and explain steps involved in developing multilingual content.	long-answer coverage; common exam command words; core topic: multilingual; broad answer scope
12	Unit 2 - Q12: Explain about advanced features and best practices in presentation software. (6)	long-answer coverage; explicit exam-mark framing; common exam command words; broad answer scope
13	Unit 3 - Q7: Give detailed steps to create website using CSS. (6)	long-answer coverage; explicit exam-mark framing; common exam command words; process/steps question
14	Unit 3 - Q6: Explain selectors in CSS. (4)	long-answer coverage; explicit exam-mark framing; common exam command words
15	Unit 3 - Q2: Explain the characteristics of static websites. (4/6)	long-answer coverage; explicit exam-mark framing; common exam command words
16	Unit 3 - Q8: Write a note on the purposes for which blogs are used. (4/6)	long-answer coverage; explicit exam-mark framing; core topic: blog; broad answer scope

Rank	Question	Why important
17	Unit 3 - Q6: Differentiate static website and dynamic website.	common exam command words; core topic: dynamic; core topic: static; comparison question
18	Unit 3 - Q22: Write the steps to customize blogs.	common exam command words; core topic: blog; process/steps question
19	Unit 4 - Q28: Differentiate between Joomla and Drupal. (4/6)	long-answer coverage; explicit exam-mark framing; common exam command words; broad answer scope
20	Unit 4 - Q19: Explain the steps involved in Add a Quiz (Assessment) in Moodle (6)	long-answer coverage; explicit exam-mark framing; common exam command words; broad answer scope
21	Unit 4 - Q23: Explain the steps involved to build website using Joomla. (6)	long-answer coverage; explicit exam-mark framing; common exam command words; broad answer scope
22	Unit 4 - Q15: Explain any six key features of Moodle. (6)	long-answer coverage; explicit exam-mark framing; common exam command words; broad answer scope
23	Unit 4 - Q13: Write the steps to create 3D animations using Blender (6)	long-answer coverage; explicit exam-mark framing; common exam command words; broad answer scope
24	Unit 4 - Q29: Write the Steps to create website using Drupal. (6)	long-answer coverage; explicit exam-mark framing; common exam command words; broad answer scope

Yellow-Marked Questions And Answers

Unit 1

YELLOW MARKED IN SOURCE | Unit 1 | Short answer | Source page(s): 2

Q8. What is the difference between WCMS and CMS.

WCMS CMS Specifically designed to manage web content. Broader than WCMS, it can manage content across various platforms, not just web. Primarily used for creating, managing, and Can be used for managing documents, digital deploying content on websites. assets, records, and other content types across different environments (e.g., intranets, extranets, web). Best suited for businesses or individuals looking Suitable for organizations needing to manage a to establish an online presence. variety of content types and workflows, both online and offline. Offers numerous plugins/extensions for May have modules/plugins for various content enhancing website functionality. management and enterprise needs.

YELLOW MARKED IN SOURCE | Unit 1 | Short answer | Source page(s): 2-3

Q9. What is content and content format?

- Content: On the Internet, content is any information that is available for retrieval by the user, including web pages, images, music, audio, white papers, drivers and software downloads as well as training, educational and reference materials .
- Content Format: These are the ways you present your content to your audience, based on its medium, style, or layout. For example, you might have content formats such as text, video, audio, image, infographic, or carousel.

YELLOW MARKED IN SOURCE | Unit 1 | Short answer | Source page(s): 3

Q10. Mention any four Text file formats.

- .htm/.html/ files
- .xml files
- .doc files
- .odt files
- .pdf files

YELLOW MARKED IN SOURCE | Unit 1 | Short answer | Source page(s): 3

Q11. Mention any four common graphic file formats.

- .bmp files
- .cgm files
- .gif files
- .jpeg/.jpg files
- . JAS files
- PICT files
- .tiff files

YELLOW MARKED IN SOURCE | Unit 1 | Short answer | Source page(s): 5

Q19. List best practices for digital graphics.

Limit the number of typefaces used. Go with a "less is more" approach. Play with scale. Reuse design elements. Mixing proportionate images and texts draws viewers' eyes to specific areas of the design.

YELLOW MARKED IN SOURCE | Unit 1 | Long answer | Source page(s): 6-7

Q1. Explain the various types of content management systems. (6)

TYPES OF CONTENT MANAGEMENT SYSTEMS:

1. **Component Content Management System (CCMS)** A component content management system, or CCMS, differs from a standard CMS in that it organizes content at a granular level. Instead of managing content page by page, it takes words, phrases, paragraphs, or photos and stores them in a central repository.
2. **Document Management System (DMS)** Paper is almost extinct. Tracking business files on paper is a thing of the past. A document management system (DMS) offers a paperless solution to manage, store, and track documents in a cloud. It provides an automated solution for uploading, processing, and sharing business documents without the hassle of printing, copying, or scanning.
3. **Enterprise Content Management System (ECM)** An enterprise content management system collects, organizes, and delivers an organization's documentation, ensuring critical information is delivered to the correct audience (employees, customers, business stakeholders, etc.)
4. **Web Content Management System (WCMS)** A WCMS lets users manage digital components of a website without prior knowledge of markup languages or web programming. A WCMS provides collaboration, authoring, and administration tools to help manage digital content. Unlike other CMSs, which deal with content destined for both the web and print, a WCMS handles exclusively web content.
5. **Digital Asset Management System (DAM)** With a digital asset management system, users can store, organize, and share digital content with ease. A DAM offers a simple, centralized library where clients, employees, or contractors can access digital content. These assets include audio, creative files, video, documents, and presentations. A DAM is cloud-based, so users can access content from anywhere.

YELLOW MARKED IN SOURCE | Unit 1 | Long answer | Source page(s): 7

Q2. Explain the features of web content management systems. (6)

The three key features of any WCMS are as follows:

- The ability to design, create and maintain personalized content for a website.
- The ability for editors to review and approve content prior to publication.
- An automated publishing process.

Additional features that a WCMS might include are: Automated, standard templates. Provides users with templates that they can easily add new or existing content to, rather than designing their own templates. Editing tools. Enables users to create and customize content, such as adding titles and headers to improve content structure, or designing webpages with drag-and-drop tools. Easily installs plugins. Gives users the ability to extend a site's functionality with plugins or modules. Software updates. Keeps the WCMS up to current web standards by updating software. Workflow management. Ensures that authorized users review and approve content before publishing. Collaboration tools. Enables multiple users to modify content. Document management. Enables businesses to manage the document lifecycle, including creation, revisions, publication, archive and removal. Multilingual. Enables the display of content in various languages. Versioning. Enables editors to retrieve previous versions of content.

YELLOW MARKED IN SOURCE | Unit 1 | Long answer | Source page(s): 7-8

Q3. What are the Advantages of using WCMS? (4)

A WCMS benefits businesses in the following ways: Low cost. A WCMS is typically inexpensive, often being free or offering subscriptions that outweigh overall costs. Easy to use. Most WCMS options are user-friendly for people who do not have a technical coding background to create or maintain content. Easily customizable. A WCMS creates a universal layout that enables beginner users to create and customize front ends easily. Workflow management. Administrators can control and personalize workflow management in a WCMS. Some WCMS options enable administrators to set up their own workflow management rules and provide them with a series of steps to set up each task. Search engine optimization (SEO). A WCMS provides businesses with the editing tools required to improve search engine ranking. The WCMS should enable users to easily create content with the correct keywords, provide meta information -- such as description, keywords and alternative text for images -- and link content within the text.

YELLOW MARKED IN SOURCE | Unit 1 | Long answer | Source page(s): 8

Q4. What are the disadvantages of using WCMS? (4)

High cost for larger implementations. A WCMS for larger companies can be expensive because it may require extensive training and certifications. WCMS maintenance can also be expensive because the software may require upgrades and licensing updates. Latency issues. Larger systems can become slower with time if the business does not keep the hardware up to date or if the cache files grow too large. Security risks. If an administrator does not regularly patch the WCMS for security threats, it remains vulnerable to hackers. To minimize security risks, administrators must monitor and maintain the many moving parts of a WCMS -- such as the web server software, MySQL and any plugins or add-ons.

YELLOW MARKED IN SOURCE | Unit 1 | Long answer | Source page(s): 8-10

Q5. Explain the various popular content types. (4/6)

Content types are the categories or classifications of your content, based on its purpose, function, or characteristics. For example, you might have content types such as blog posts, products, events, testimonials, or FAQs.

Most popular types of content: The best websites create a mix of different content types to keep their readers interested. While there are hundreds of different types of web content some of the important content types are mentioned below:

Articles: Articles are a type of web content that explore a specific idea or topic in detail. They often include interviews with experts, quotes from various sources, and data to back up the main points. Articles are usually longer than other types of online content, typically ranging from 1,000 to 3,000 words. This length allows for a thorough exploration of the subject.

Blog posts: Blog posts are short articles typically between 500 and 750 words long. They cover a wide range of subjects, including industry news, profiles of important people, and reviews of new products. Blog posts are designed to be quick and easy to read, providing useful or interesting information in a concise format. They aim to engage readers with timely and relevant content without being too lengthy.

Surveys: Surveys are a valuable addition to your content, as they gauge reader interest and boost engagement with your brand. They are interactive and fun, making them one of the most engaging types of content for your audience. This helps create a stronger connection with your readers.

Quizzes: Quizzes engage your readers by presenting a question on one page and the answer on the next. This setup increases the chances of ad revenue and click-throughs, making quizzes a fun and effective way to interact with your audience. **Photos** Images help make your content more visually appealing, and contribute to the overall user experience. Additionally, optimizing your photos with alt-text and captions to your images can even help with your rankings on Google Images. **Videos** Using videos is a great way to diversify your content and add visual interest to your pages. These can be videos you take yourself or videos from sources like YouTube or Vimeo. (Just make sure to give credit where credit is due.)

E-books: E-books offer your readers more detailed information that they can download or read directly on your site. They enhance your regular content and help establish your company as an expert in your field. Promoting an e-book is a great way to build your brand's authority.

Book reviews: Book reviews let you share your thoughts on books you've read about a specific topic. Be sure not to spoil any surprises in the story. You can also ask your readers about their favorite books to boost engagement.

Product reviews: Product reviews are a great perk of having a successful blog or website, as companies often send you products for free to review. You can also buy products to review, avoiding any ethical issues that come with accepting free gifts.

Recipes: Who doesn't like cooking? Just make sure that you only post original recipes. While ingredient lists aren't subject to copyright restrictions, the instructions on how to cook a dish are. So, ensure your cooking instructions are your own to avoid legal issues. Sharing original recipes adds uniqueness and authenticity to your content, making it more valuable to your audience.

Announcements: Do you have a new employee, product, or even some new swag? Let your readers know about it in an announcement post. Market your site as the place readers can learn about news from your company before any other source. **FAQs** Everyone has questions. A FAQ (frequently asked questions) page is one of the best content types to help address common questions all in one place. This helps you better manage your time and not have to answer the same question over and over again

YELLOW MARKED IN SOURCE | Unit 1 | Long answer | Source page(s): 15-16

Q11. How to create digital graphics? (6)

Most graphic designs today are digital, created on computers. The elements of the graphic design are arranged in an attractive manner using specialized graphics software. Once the digital graphic design is complete, it may be printed with a computer printer, or sent to a commercial printer.

Things You'll Need:

- Computer
- Graphics software
- Pencil and paper
- Printer
- Photo or illustration, optional
- Scanner, optional

Step 1 Prepare your design idea with pencil and paper. Decide what words, images, colors and shapes to use in your digital graphic design. Use the pencil to make a few rough sketches of how your design should look. Try several different layouts, combining the typography, images and shapes in an attractive manner that effectively communicates your message. Color information may be noted to the side of the rough sketch, or added using color pencils. These are quick sketches to develop your design idea, not finished designs.

Step 2 Turn on your computer and open a file in a graphics program. Among the more popular graphic design programs are InDesign, Photoshop and Illustrator from the Adobe software company, and Corel Graphics Suite. Open Office Draw may be downloaded for free (see Resources).

Step 3 Name the file and save it. Type in the words you will use in your design. Select a font for the words. Resize the words and place them according to your rough pencil sketch. Select a new color for the words if indicated in your rough sketch. Your words have become typography for the purpose of your digital graphic design.

Step 4 Import any existing photo or illustration files you need into your digital graphics file using the design software's "Import File" feature. If you only have a hard copy of the photo, use a scanner to create a digital file. After importing, resize as needed and position in your design as per your rough pencil sketch. You may also simply open the photo or illustration file, copy it and paste it directly into your digital graphics file.

Step 5 Use the tab features in the design software to add graphic and color elements as per your rough pencil sketch. Borders may be added to photos, for example. A variety of shapes may be added and colorized as needed.

Step 6 Print out a copy of your digital graphic design to check it. Make changes as desired. Print your final copy or copies, or copy your project onto a CD or memory card and have it commercially printed. In some cases, you may be able to email the project directly to a commercial printer.

YELLOW MARKED IN SOURCE | Unit 1 | Long answer | Source page(s): 17-19

Q13. Explain the content development guidelines according to Mick Wood. (6)

According to Mick Wood, following guidelines help content developers to cater for the needs of all Internet users. **Screen Layout** Screen layout should be consistent. The more consistent a website is in its design, the easier it will be for users to navigate. Users, especially persistent users, tend to learn and remember the location of key, functions and controls. **Logos** Screen layout should include logos, navigation buttons and footer information. Putting the logo in a consistent place on every page (usually top left) ensures that visitors are fully aware that they are on the same site. **Update Information** 'Page Last Updated' information needs to be included. Visitors will quickly know if you have added any new content to your site, and it may prompt you to do so. The date format should be understandable, i.e., 1st February 2003 is better than 02-01-2003. In the UK 02-01-03 means 2nd January 2003 and in USA it means 1st February 2003. **Links** A link to the home page should be added to every page except the homepage itself. Pages should not link to themselves as this can confuse some users. Making your logo the home page link is considered to be a good practice. **Image Sizes** Considerable number of Internet users still use modems with connection speeds of 33K or less. Pages should therefore be kept to a maximum of 35K ensuring download times of less than ten seconds for these users. Visitors may not wait if your pages take too long to download. All images, including spacer images, should include alternative text. The alternative

text should describe the function of the image, if applicable: Use of Frames should not be used unless absolutely necessary. Frame-based sites can be confusing for the visually disabled, particularly those using -screen readers or speech browsers - users can easily become disorientated. Additionally, users cannot easily bookmark individual pages within a frame-based site. Page Title Each page should have a descriptive and different title, clear and helpful headings, and a logical structure. Titles are used by search engines to identify web 'pages, If two or more. pages have the same title they cannot easily be differentiated by users. Font Attributes The FONT tag should generally be avoided III creating accessible websites. While attribute specifications like SIZE="+ 1" or SIZE="- 1" are relatively harmless, absolute sizes like SIZE="1" can result in text that is too small to read. Instead: Cascading Style Sheets should be used to font web pages. Style sheets allow authors to suggest relative changes in font size with much greater flexibility than is allowed under FONT. Color Attributes The COLOR attribute of the FONT tag should always be avoided since many browsers still display the font color when the user tries to override author specified colors. The result could be an unreadable document if the font color does not contrast well against the reader's chosen background. Text Size and Font Text should be the equivalent of size 12 points to enhance reading performance. Research has shown that there is no noticeable difference in reading speed or user preference between Times New Roman, Georgia or other serif fonts and Helvetica, Arial or other sans-serif fonts. The FACE attribute of the FONT tag cannot be overridden by the user in many browsers. This may result in the author choosing a font that is very difficult to read given the user's platform and environment settings. The same font may display strangely on different platforms. Link Identification Links should be Clearly identified and it should make sense when reading out of context. Links should never be designated with the text 'click here'. Some screen readers can be set to read out a list of links on a particular page; a list of 'click here' links is not helpful. . Blue underlined text is the preferred choice for all links. Some users miss links because the text is not underlined. Research shows that users can easily find links which include visual cues, that is, links that are underlined, rather than having to move the mouse to see when the pointer changes to a hand (this is known as mine sweeping). Visited links should be designated using a different colour. Many users use link colours to identify which parts of a site they have already visited. Page Display. Pages should be fluid flexible because users browse the Internet using a variety of screen resolutions. Pages should be designed to expand or contract according to the user's settings, thus preventing horizontal scrolling. Horizontal scrolling is. a particular problem for screen reader users because the screen reader does not automatically scroll horizontally - users may miss important content. Device Independence Pages should be device independent. Not all users navigate websites using a mouse - many disabled users use Assistive Technology. All users should be able to navigate the site using the input device of their choice. Keyboard shortcuts, using the 'access key' attribute, should be provided for key links. Readability Paragraphs and sentences should be kept short. Readability improves when sentences 'and paragraphs are kept relatively short. Users tend to scan web pages and will often skip over large chunks of text. While these guidelines aren't formal, hosts of electronic documents should still adhere to them. Content and organization issues are being looked at closely to establish standard norms and guidelines for content development. Organizations like the International Organization for Standardization (ISO) are involved in this process. For instance, ISO 8879 deals with SGML, the Standard Markup Language for the web, and has been adopted by initiatives like the Text Encoding and Interchange (TEI) for structuring web documents.

Unit 2

YELLOW MARKED IN SOURCE | Unit 2 | Short answer | Source page(s): 1

Q2. Mention the types of web hosting services.

- Free Hosting
- Virtual or Shared Hosting
- Dedicated Hosting
- Co-location Hosting
- Cloud hosting

YELLOW MARKED IN SOURCE | Unit 2 | Short answer | Source page(s): 2

Q9. Mention the basic elements of multimedia.

There are five basic elements of multimedia: text, images, audio, video and animation.

YELLOW MARKED IN SOURCE | Unit 2 | Long answer | Source page(s): 6-7

Q1. List and explain the different features of web hosting? (4/6)

Most web hosting companies provide different hosting packages and plans. Your monthly web hosting cost can range from free to paid, depending on factors such as the following:

- Size of your website.
- Number of daily website visitors.
- Peak time website or webpage traffic.
- Web hosting features that you require Before selecting a web hosting service, explore the different features that various services provide. The following are the main features generally provided. Disk space Your website will require storage space for emails, web files, images, and databases. While you are estimating your storage requirements, also consider future website growth and website traffic. Low disk space impacts user experience, so it is an important factor in the selection of a web hosting service. Bandwidth and data transfer In the web hosting industry, the terms bandwidth and data transfer are often used interchangeably. However, they are two different things. Bandwidth is the amount of data that your website can transfer to visitors at one time. Data transfer is the actual amount of data that it transfers. You can think of bandwidth as a pipe. The bigger the pipe, the more the water can pass through it. However, for various reasons, you might not use the total capacity of the pipe. Data transfer is like the actual amount of water that goes through the pipe in a given time period. Email accounts Many web hosting plans include an email account. You can link your email address to your website name. For example, if your website name is example.com, your email address will be yourname@example.com. The following are the main types of email accounts. POP3 POP3 accounts give you server space to store your emails, which you can access directly or by using your email client program. Forwarding mail Forwarding mail accounts redirect emails to another email address. This account could be a personal email account with an email service provider or a third-party account that manages your website emails for you. Aliases Some web hosts have emails plans that you can use to create several aliases or email account names without creating a full POP3 account. For example, you might want to display sales@, support@, and orders@ addresses on different pages of you website. Instead of having multiple POP3 accounts that need to be checked and administered, you could redirect everything to a single inbox. FTP access FTP refers to website file transfer and sharing. Many websites have documents, such as PDF files or image files, that they want internet users to download. The web hosting company uses FTP access to provide this service.

YELLOW MARKED IN SOURCE | Unit 2 | Long answer | Source page(s): 7-10

Q3. Explain the different steps to host a website. (8)

Steps to Host a website:

Step 1: Decide What Type of Website You Want: You will typically find 2 types of websites: Static or Basic Websites: Static websites are simple websites with one or more web pages (called HTML pages). You can build them on your computer with software like Dreamweaver and then upload the pages to your host's server using any FTP software (such as FileZilla). Whenever you need to make changes to your website, you'll have to edit the pages on your computer and upload them again. Since they cannot be modified dynamically, such websites are called static websites. Static websites are cheaper than dynamic websites (below) but come with limited functionality and no option for e-commerce or interactivity. Dynamic Websites: Dynamic websites contain information that changes, depending on the time of the day, the viewer and other factors. They make use of both client-side and server-side scripts to create and update content. Client-side scripts, which run on a user's computer, are mainly used for appearance and interaction purposes. Server-side scripts, which reside on a server and are extensively used by E-commerce and social networking sites, allow users to have individual accounts and provide a customized response for each user. Dynamic websites are CMS-driven, and allow you to directly add and edit content (i.e. text, design, photos, and videos), as well as let your visitors leave comments and start discussions. Dynamic websites are ideal for businesses and organizations. Examples of dynamic websites include blogs, forums, photo galleries and e-commerce sites.

Step 2: Choose Your Hosting Server Unlike static HTML sites which can be hosted on most web servers, when it comes to web applications, there are basically two types of hosting platforms. Depending on your hosting

needs and what you're most comfortable with, you can choose from: Linux Hosting, which allows running scripts written in PHP, Perl, Python and other Unixoriginated languages, and usually supports PostgreSQL and MySQL databases. This is the most commonly used system today. Windows Hosting, which allows running ASP scripts utilizing .NET and other Microsoft technologies, and supports Microsoft SQL Server and Access database.

Step 3: Select Your Web Hosting Plan You will typically find a wide range of services in web

hosting, such as: Shared Hosting: In shared hosting, you get to share the physical server with other website owners. However, you will have your own separate account (secured with login credentials). Shared hosting is very affordable because the cost of operating the server is shared between you and the other website owners. VPS Hosting (Virtual Private Server Hosting): In VPS hosting, every website is stored on a very powerful server that is divided into several virtual compartments. The server software is configured separately so that each unit can function independently. It should be your preferred option if you have high-security concerns but don't want to invest in a faster (but costlier) dedicated server. Dedicated Hosting: Dedicated hosting offers you an entire server for yourself, thereby making it faster, more secure...and costlier. It is the ideal solution for larger businesses and high-traffic websites because it allows for maximum customization, configuration, installation and flexibility. Cloud Hosting: Cloud hosting allows multiple virtual servers (clouds) to work together to host a website or a group of websites. It offers unlimited ability to handle sudden traffic spikes. A cloud-hosted website is not limited to a single server, and the resources allocated to it can shrink or expand dynamically, depending on how much traffic you get. It's a great option for large websites, including e-commerce websites, newsletters and Blogs.

Step 4: Change Your DNS Address After you have purchased your web hosting, you will get Name Servers (also known as Domain Name Servers or DNS) - which is the Internet's equivalent of a phone book that contains IP Addresses. To get your website up and working, you will need to change the Name Servers of your domain. It's a simple but mandatory step for you to get started. Go to your Domain Control Panel via <http://manage.hostgator.in/customer>.

1. Enter your registered email address and password.
2. Click on the Domain Name for which you need to change the Name Servers.
3. In the Domain Registration section, click on the Name Servers option.
4. Replace the existing Name Servers with the ones provided by your current web host, and click on the Update Name Servers button.

Step 5: Upload Your Website You can now upload your website to your account by connecting to the server using either cPanel's File Manager or FTP Client (such as FileZilla) - after which your website will go live. **How to Upload Your Website Using cPanel File Manager** o Log in to your cPanel. o Click on the icon titled File Manager. o Select Web Root and click on Go. o Add all the files and folders under public_html and their respective domain folder. **How to Upload Your Website Using FTP Client** You can connect to FTP via an FTP program such as FileZilla Client. It allows you to see the files and folders on our server like you'd see them on your computer. You can use it to drag and drop your website's files into the /public_html/ folder.

To connect to your web server via FileZilla, follow these steps:

1. Install FileZilla and open it
2. From the File menu, select Site Manager
3. Click on New Site
4. Enter the username and password you received in your welcome mail
5. Set the Port to 21 (FTP always runs on Port 21)
6. Click Connect

Once your FTP is connected, you will see the files and folders of your: Local computer on the left Web hosting service on the right

To upload files to your hosting service provider via FileZilla, follow these steps:

1. From the left-hand side of FileZilla, select the file(s) and folder(s) you want to upload
2. Drag and drop the file(s) and folder(s) to the directory location on the right side of your web hosting service. FileZilla will now start uploading.
3. After the uploading is finished, FileZilla log will confirm success and your uploads will be visible on the right-hand side. Your website is now live now!

YELLOW MARKED IN SOURCE | Unit 2 | Long answer | Source page(s): 13-14

Q8. Explain in detail the different steps to create a presentation using Google Slides. (6)

Google Slides offers a user-friendly interface for designing slideshows collaboratively.

Here are detailed steps to help you create a presentation using Google Slides:

Step 1: Access Google Slides

1. Open your web browser and go to Google Slides.
2. Sign in to your Google account. If you don't have one, you can create a Google account or use an existing Gmail account.

Step 2: Create a New Presentation

3. On the Google Slides homepage, click on the "+" (plus) sign to create a new presentation.
4. You can choose a blank presentation or select a template by clicking on "Blank" or "From a template," respectively.

Step 3: Customize Slide Layout and Design

5. Once you're in the presentation editor, you can customize the layout and design of your slides. **Slide Layout:** Click on the "Slide" menu and choose "Layout" to select different slide layouts for your content, such as title slides, content slides, or section headers. **Theme:** Click on the "Slide" menu, then "Change background" to choose a theme or customize the background color of your slides. **Font and Text Formatting:** Use the toolbar to change font styles, sizes, and formatting options.

Step 4: Add Content to Slides

6. Click on the "+" button in the toolbar to add a new slide. Choose the type of slide you want to add (title slide, content slide, etc.).
7. Click on the text boxes to add your title and content. You can also insert images, videos, charts, and other elements using the "Insert" menu.
8. Continue adding slides and content until your presentation is complete.

Step 5: Collaborate with Others

9. Click on the "Share" button in the top-right corner to collaborate with others. Enter email addresses to invite collaborators, set their permissions, and add a message.
10. Collaborators can simultaneously work on the presentation in real-time. Changes are automatically saved to Google Drive.

Step 6: Insert Transitions and Animations

11. Click on the "Transition" button to add slide transitions between slides. Use the "Animations" menu to add entrance, exit, and emphasis animations to individual elements on a slide.

Step 7: Present and Preview

12. Click on the "Present" button in the top-right corner to enter presentation mode. Navigate through the slides using the arrow keys.
13. Use the "Present" button in the bottom-right corner to preview how your presentation will look to your audience.

Step 8: Save and Export

14. Your presentation is automatically saved to Google Drive. However, if you want to download it, click on "File" and choose "Download." Select the format you prefer, such as PowerPoint, PDF, or other options.

Step 9: Share and Publish

15. Click on the "Share" button to share your presentation with others. You can either invite collaborators or generate a shareable link.
16. If you want to embed your presentation on a website or blog, click on "File," then "Publish to the web." Configure settings and click "Publish."

Step 10: Edit and Revise

17. If you need to make edits after sharing, collaborators can make changes in real-time, and the presentation will be updated automatically.
18. To revise your presentation, open it in Google Slides, make changes, and click "File" > "Save" to ensure the updates are saved.

YELLOW MARKED IN SOURCE | Unit 2 | Long answer | Source page(s): 16-17

Q11. What are the advantages of using wikis? (4/6)

1. Collaborative Editing: Advantage: Wikis enable multiple users to collaboratively create and edit content. This collaborative approach facilitates the pooling of knowledge and expertise from diverse contributors.
2. Open Accessibility: Advantage: Most wikis are open and accessible to the public, allowing users to contribute without the need for advanced technical skills. This openness encourages a wide range of individuals to participate.
3. Ease of Use: Advantage: Wikis typically have user-friendly interfaces and straightforward editing tools. The simplicity of markup language or rich-text editors makes it easy for contributors to format and edit content.
4. Interconnected Structure: Advantage: Wikis utilize hyperlinks to connect related pages, creating an interconnected structure. This facilitates easy navigation and allows users to explore diverse topics within the same wiki.
5. Revision History: Advantage: Wikis maintain a detailed revision history, documenting every change made to a page. This feature allows users to track the evolution of content, review edits, and revert to previous versions if needed.
6. Knowledge Sharing: Advantage: Wikis serve as effective platforms for knowledge sharing. They are commonly used for creating documentation, instructional materials, encyclopedias, and other repositories of information.
7. Community Collaboration: Advantage: Wikis often foster a sense of community collaboration, where contributors collectively shape the content and governance of the platform. This community-driven approach encourages diverse perspectives.
8. Rapid Updates: Advantage: Wikis allow for rapid updates and real-time collaboration. This is particularly useful when information needs to be kept current or when a group of contributors is working together on a project.
9. Transparency and Accountability: Advantage: The revision history and user attribution in wikis provide transparency and accountability. Users can see who made edits, when changes were made, and review edit summaries, promoting responsible editing behavior.
10. Documentation and Information Retrieval: Advantage: Wikis are effective tools for documentation. They provide a centralized location for information, making it easy for users to retrieve and reference information quickly.
11. Flexible Structure: Advantage: Wikis often have a flexible and adaptable structure. Pages can be easily created, edited, and reorganized to accommodate evolving content needs.
12. Search Functionality: Advantage: Most wikis include robust search functionality, allowing users to quickly find relevant information within the vast amount of content available. This enhances the overall usability of the platform.
13. Cost-Effective Collaboration: Advantage: Wikis are often cost-effective collaboration tools. Many wiki platforms are open-source or offer free versions, making them accessible to a wide range of users and organizations.
14. Supports Remote Collaboration: Advantage: Wikis support remote collaboration, allowing contributors from different locations to work on the same project. This is particularly valuable in today's global and distributed work environments.
15. Continuous Improvement: Advantage: The collaborative nature of wikis encourages continuous improvement. Contributors can update content as needed, ensuring that information remains accurate and relevant over time.

YELLOW MARKED IN SOURCE | Unit 2 | Long answer | Source page(s): 21-22

Q16. Write the advantages of multilingual content development. (6)

1. Global Reach: Expands audience outreach to diverse markets, enabling businesses to connect with individuals globally and increase their brand presence on an international scale.
2. Improved User Experience: Increases engagement with content tailored to users' languages, ensuring a positive and user-friendly experience that resonates with individuals on a personal level.
3. Increased Accessibility: Enhances inclusivity by catering to different linguistic backgrounds, making information more accessible to a wider audience and breaking down language barriers.
4. SEO Benefits: Boosts search engine rankings in various regions, optimizing content for search engines in different languages and increasing visibility globally.
5. Cultural Relevance: Ensures authenticity and sensitivity to cultural nuances, creating content that resonates with diverse audiences and fosters a deeper connection with the brand.

6. Competitive Advantage: Differentiates businesses and demonstrates adaptability, providing a strategic edge by appealing to a wider market and addressing the diverse needs of consumers.
7. Brand Consistency: Maintains consistent brand messaging across languages, reinforcing a unified brand identity and preventing potential confusion among global audiences.
9. Loyalty and Trust: Builds trust by communicating in users' preferred languages, establishing a stronger connection and fostering loyalty among a global customer base.
10. Adaptation to Local Markets: Tailors marketing to align with local preferences, adapting promotional strategies to resonate with cultural nuances and preferences.
11. Legal and Regulatory Compliance: Meets legal requirements for language-specific information, ensuring compliance with regulations in regions where specific language disclosures are mandated.
12. Effective Communication: Reduces misunderstandings and ensures clear communication, enhancing effective communication by conveying messages accurately and avoiding language barriers.
13. International Collaboration: Facilitates collaboration among diverse global teams, breaking down language barriers and promoting effective communication and cooperation.
14. Social Media Engagement: Broadens social media reach across linguistic communities, leveraging the power of multilingual content to engage with a wider audience on various social media platforms.
15. Educational Resources: Enhances accessibility of learning materials globally, making educational resources available in multiple languages and improving accessibility for learners worldwide.

Unit 3

YELLOW MARKED IN SOURCE | Unit 3 | Short answer | Source page(s): 1

Q2. What is content generation?

Dynamic websites generate content on the server side in response to user requests or interactions. Content is often retrieved from databases or external sources and can vary based on user preferences, actions, or the current state of the website.

YELLOW MARKED IN SOURCE | Unit 3 | Short answer | Source page(s): 1

Q3. Define static website. Write example.

A static website is a type of website that displays fixed content to users and remains the same unless manually updated by a developer. The content on static websites doesn't change dynamically based on user interactions or real-time events. Each page of a static website is prebuilt and stored as HTML files, and when a user requests a page, they receive the same content that was initially created by the developer.

YELLOW MARKED IN SOURCE | Unit 3 | Short answer | Source page(s): 2

Q8. Expand AJAX. What is the use of it?

Asynchronous JavaScript and XML

- Improved User Experience: AJAX can load new data into a webpage without refreshing the whole page. For example, when you scroll through your social media feed and new posts appear automatically.
- Reduced Server Load: Only the necessary data is sent to and from the server, which reduces the amount of data transferred and the load on the server.

YELLOW MARKED IN SOURCE | Unit 3 | Long answer | Source page(s): 5-6

Q1. Explain the characteristics of dynamic websites. (4/6)

1. Content Generation:

- Dynamic websites generate content on the server side in response to user requests or interactions.
 - Content is often retrieved from databases or external sources and can vary based on user preferences, actions, or the current state of the website.
2. Interactivity:
- Dynamic websites are highly interactive, allowing users to engage with various features, submit forms, and experience real-time updates.
 - Interactivity is achieved through server-side scripting languages (e.g., PHP, Python, Ruby) and client-side scripting languages (e.g., JavaScript).
3. Database Integration:
- Dynamic websites frequently use databases to store and manage data.
 - User-generated content, account information, and other dynamic elements are often stored and retrieved from databases to provide a personalized experience.
4. User Authentication and Accounts:
- Dynamic websites often include user authentication systems, enabling users to create accounts, log in, and access personalized content.
 - User sessions and account information are managed on the server to ensure security and privacy.
5. E-commerce Functionality:
- Many dynamic websites are designed for e-commerce, allowing users to browse products, add items to a shopping cart, and complete transactions.
 - Shopping carts, order processing, and inventory management are handled dynamically
6. Content Management Systems (CMS):
- Dynamic websites often employ Content Management Systems to facilitate easy content updates.
 - CMS allows website administrators to add, edit, or remove content without the need for extensive coding or technical knowledge.
7. Real-time Updates:
- Information on dynamic websites can update in real-time, providing users with the latest data, news, or changes.
 - This real-time functionality enhances the user experience and keeps the content relevant
8. Scalability:
- Dynamic websites can handle a large amount of data and traffic, making them suitable for scalable and complex web applications.

YELLOW MARKED IN SOURCE | Unit 3 | Long answer | Source page(s): 7

Q3. Explain any four/six differences between static and dynamic websites. (4/6)

Static Website The content remains fixed and doesn't change unless manually updated by a user interactions, database updates, or other developer real-time events. Built using HTML and CSS. It's simple and involves more complex coding with easy to create but lacks interactive features. server-side scripting languages like PHP, Python, or Ruby, enabling dynamic content generation. Generally faster since all content is pre-built. May have slower loading times as content is generated on the server based on user each user request. requests. Manual updates are required for content changes. Each page needs to be individually modified. the need to modify each page individually. Typically, easier to scale as it involves pre-built files. Suitable for small to medium-sized websites. content dynamically. Suitable for larger and more complex websites. Limited interactivity. Interaction is mostly limited to hyperlinks. forms, submit data, and experience real-time updates. Brochure websites, portfolios, personal blogs. Social media platforms, e-commerce sites, with fixed content. news websites, and web applications with user accounts.	Dynamic Website Content can change dynamically based on change. Content updates can be automated, and changes are reflected across the site without modified. May require more server resources as the serving pre-built content dynamically. Highly interactive. Users can engage with limited to hyperlinks. forms, submit data, and experience real-time updates. Brochure websites, portfolios, personal blogs. Social media platforms, e-commerce sites, with fixed content. news websites, and web applications with user accounts.

YELLOW MARKED IN SOURCE | Unit 3 | Long answer | Source page(s): 7-8

Q4. Write a note on any THREE dynamic websites. (6)

1. Facebook generates personalized content based on the user's actions. The things you see on the website change depending on the accounts you follow, the content you're engaging with, or the people you have on your friends list.
2. Twitter, much like Facebook, alters the content you see based on different factors like your search queries and public and private lists. In addition, your engagement, such as retweets and likes, also prompts Twitter to generate content related to your past actions.
3. YouTube utilizes an algorithm that alters your feed based on the accounts you subscribe to, the videos you watch, and other related content that aligns with your viewing habits. Google is the world's most popular search engine and one of the best examples of a dynamic website. The search engine indexes billions of websites, both new and refreshed, utilizing its algorithm to select, rank, and generate the best results for user-based queries.
4. WordPress is a website creation platform that allows users to customize most of what they want to showcase on their page. It's a dynamic website because it automatically refreshes the content in real-time, not only on your end but from the visitors' point of view.

YELLOW MARKED IN SOURCE | Unit 3 | Long answer | Source page(s): 8-9

Q5. Illustrate the steps for creating dynamic web content. (6)

Creating dynamic web content involves using technologies and techniques that allow your website to display and update content in real-time based on user interactions, database changes, or external data sources. Here's a general guide on how to create dynamic web

content:

1. Choose a Server-Side Language: Select a server-side scripting language such as PHP, Python, Ruby, or Node.js. This is where you'll handle server-side logic.
2. Set Up a Server:
 - Choose a web server (e.g., Apache, Nginx) to host your dynamic web application.
 - Configure your server to handle the chosen server-side language.
3. Database Integration:
 - Choose a database system (e.g., MySQL, PostgreSQL, MongoDB) to store and retrieve dynamic content.
 - Establish a connection between your server-side language and the database.
4. Server-Side Programming:
 - Write server-side scripts to generate dynamic content based on user requests.
 - Use server-side logic to query the database, process data, and generate dynamic HTML or other markup.
5. Front-End Development:
 - Use HTML, CSS, and JavaScript to create the user interface.
 - Employ a front-end framework like React, Angular, or Vue.js for a more interactive experience.
6. AJAX (Asynchronous JavaScript and XML):
 - Implement AJAX to enable asynchronous data exchange between the browser and the server.
 - Use JavaScript to update specific parts of the page without requiring a full page reload.
7. Web APIs:
 - Create or integrate with web APIs to fetch data from external sources dynamically.
 - APIs allow you to access and manipulate data from services like social media platforms, weather APIs, etc
8. Content Management Systems (CMS):
 - Consider using a CMS (e.g., WordPress, Drupal) that provides a user-friendly interface for managing dynamic content.

- Customize your CMS to integrate with your dynamic content needs.

9. User Authentication and Authorization:

- Implement user authentication to allow personalized content for logged-in users.
- Control access to different parts of your dynamic content based on user roles.

10. Caching:

- Implement caching mechanisms to enhance performance by storing frequently accessed dynamic content.
- Consider using caching systems like Redis or Varnish.

11. Testing: Regularly test your dynamic web content across different browsers and devices to ensure compatibility and responsiveness.

12. Security: Implement security best practices, including input validation, protection against SQL injection, and secure data transmission (HTTPS).

13. Scalability: Design your dynamic web application to be scalable, allowing it to handle increased traffic and data.

14. Monitoring and Analytics: Implement monitoring tools and analytics to track user interactions, performance, and potential issues.

15. Continuous Improvement: Regularly update and improve your dynamic content based on user feedback and changing requirements.

Q9. Enumerate the steps to create your own blogs. (6)

Creating your own blog involves several steps, from choosing a niche to selecting a platform and customizing your design.

Here's a step-by-step guide to help you start your own blog:

Step 1: Define Your Purpose and Niche

1. Choose a Topic (Niche): Decide on the main theme or subject of your blog. Consider your passions, expertise, and the interests of your target audience.
2. Define Your Purpose: Clarify the goals of your blog. Are you writing to inform, entertain, inspire, or sell products/services?

Step 2: Choose a Blogging Platform

3. Select a Blogging Platform: Choose a platform that suits your needs. Popular options include WordPress, Blogger, Medium, and Wix.
4. Purchase a Domain Name: Choose a unique and memorable domain name for your blog. You can purchase a domain through domain registrars like GoDaddy or Namecheap.

Step 3: Set Up Your Blog

5. Choose a Hosting Provider: If you choose a self-hosted platform like WordPress.org, select a hosting provider. Bluehost and SiteGround are popular choices.
6. Install Your Blogging Platform: Follow the instructions provided by your hosting provider to install your chosen blogging platform.

Step 4: Customize Your Blog

7. Select a Theme: Choose a visually appealing and responsive theme for your blog. Most platforms offer a variety of free and premium themes.
8. Customize Design Elements: Personalize your blog by customizing colors, fonts, and layout. Make sure your design aligns with your blog's theme and target audience.

Step 5: Create Compelling Content

9. Plan Your Content: Develop a content plan. Decide on the types of posts you'll create, their frequency, and how they align with your blog's goals.

10. Write and Format Posts: Create engaging and well-formatted blog posts. Use images, headers, and lists to make your content visually appealing.

Step 6: Optimize for SEO

11. Understand SEO Basics: Learn the basics of Search Engine Optimization (SEO). Use keywords naturally in your content and optimize meta tags.

12. Submit Your Sitemap: Submit your blog's sitemap to search engines like Google. This helps search engines index your content.

Step 7: Engage with Your Audience

13. Enable Comments: Allow readers to leave comments on your blog posts. Respond to comments and engage with your audience.

14. Social Media Integration: Share your blog posts on social media platforms. Integrate social sharing buttons on your blog for easy sharing.

Step 8: Monetize Your Blog (Optional)

1. Explore Monetization Options: If you plan to make money from your blog, explore options like affiliate marketing, sponsored posts, or selling products/services.

2. Set Up Revenue Streams: Implement revenue streams, such as Google AdSense for ads or affiliate marketing links, if applicable.

Step 9: Regularly Update and Promote

3. Consistent Posting: Stick to a consistent posting schedule. Regularly update your blog with fresh and valuable content.

4. Promote Your Blog: Actively promote your blog through various channels, including social media, email newsletters, and collaborations with other bloggers.

Unit 4

Q2. Explain any six key categories of e-publishing. (6)

1. E-Books: Digital versions of books that can be read on e-readers, tablets, smartphones, and computers.
2. Digital Magazines and Periodicals: Publications in digital format, often enhanced with multimedia elements, for consumption on various devices.
3. E-Journals and Academic Publications: Academic and scholarly content distributed digitally, including research articles, journals, and scientific publications.
4. E-Newspapers: Digital versions of traditional newspapers, providing news content in various formats for online readership.
5. Interactive E-Books: E-books that incorporate interactive elements, multimedia, and enhanced features for a more engaging reading experience.
6. Digital Comics and Graphic Novels: Comic books and graphic novels distributed in digital formats, often featuring interactive elements.
7. Audiobooks and Podcasts: Spoken-word content, including narrated books (audiobooks) and audio series (podcasts), delivered digitally.
8. Educational E-Textbooks: Digital textbooks designed for educational purposes, often enriched with multimedia, quizzes, and interactive elements.
9. Corporate and Technical Documentation: Business documents, technical manuals, and corporate publications distributed digitally for internal and external use.
10. Interactive Learning Content: Educational content that goes beyond traditional textbooks, incorporating interactive features, simulations, and multimedia for a more engaging learning experience.
11. Legal and Regulatory Documents: Legal texts, government publications, and regulatory documents distributed in digital formats for accessibility and reference.
12. Digital Catalogs and Brochures: Marketing and promotional materials, including product catalogs and brochures, distributed digitally for easy access and sharing.
13. Self-Publishing and Independent Authors: Platforms that enable independent authors to self-publish their works digitally, reaching a global audience without traditional publishing processes.
14. Online Newsletters and Periodic Updates: Regularly distributed digital newsletters and updates providing information on specific topics or industries.
15. Mobile Apps and Games: Mobile applications and digital games delivered through online app stores and platforms.
16. Web Content and Blogs: Online articles, blog posts, and web content published and distributed digitally. These categories represent the diverse landscape of e-publishing, demonstrating the broad range of digital content available to consumers across various industries and interests.

YELLOW MARKED IN SOURCE | Unit 4 | Long answer | Source page(s): 10

Q5. Explain different types of simulation. (4/6)

1. Physical Simulation: Description: Involves creating a physical model that behaves similarly to the real system. Examples include crash test simulations for automobiles or fluid dynamics simulations for aircraft design.
2. Computer Simulation: Description: Utilizes computer programs to model the behavior of a system or process. Computer simulations are widely used in fields like physics, engineering, economics, and social sciences.
3. Training Simulations: Description: Simulations designed for training purposes, providing a safe and controlled environment for individuals to practice and enhance their skills. Examples include flight simulators for pilots and medical simulations for healthcare professionals.
4. Monte Carlo Simulation: Description: A statistical method that uses random sampling to model the probability of different outcomes in a process. It is commonly used in finance, project management, and risk analysis.
5. Business Process Simulation: Description: Models the workflow and processes within a business. It helps organizations optimize their operations, test strategies, and identify potential improvements.

YELLOW MARKED IN SOURCE | Unit 4 | Long answer | Source page(s): 21-23

Q16. Explain the steps involved in creating a new course and uploading the content in Moodle. (6)

Creating new course in Moodle: Creating an online course in Moodle involves several steps.

Here's a step-by-step guide:

Step 1: Accessing Moodle:

1. Log In: Log in to your Moodle account using your credentials.
2. Access Dashboard: After logging in, you will land on the dashboard. Locate and select the course category where you want to create the new course.

Step 2: Creating a New Course:

3. Navigate to Courses: In the left sidebar or main menu, find and click on "Courses."
4. Create a New Course: Look for an option to create a new course. This might be labeled as "Create a new course" or something similar.
5. Fill in Course Details: Enter essential details for your course, including the course name, category, and a brief description. You might also set the enrollment method, format, and visibility options.

Step 3: Configuring Course Settings:

6. Configure Course Format: Choose a course format (weekly, topics, social, etc.) based on how you want to organize your course content.
7. Set Course Start Date: Define the start date of your course, indicating when learners will gain access to the materials.
8. Manage Enrollments: Determine how learners will be enrolled. Options may include self-enrollment, manual enrollment, or enrollment key.

Step 4: Adding Content:

9. Navigate to Course Content: Enter your newly created course. You'll find tabs or sections for various course elements.
10. Add Topics/Sections: Moodle often organizes content into topics or sections. Add these and name them according to your course structure.
11. Upload Resources: Within each section, add resources such as files, documents, videos, or external links. Moodle supports various resource types.
12. Create Activities: Incorporate interactive elements by adding activities like quizzes, assignments, forums, and surveys. These engage learners and assess their understanding.

Step 5: Customizing Appearance:

13. Customize Appearance: Explore options to customize the appearance of your course. This might include adding a course image, specifying display options, and adjusting the course layout.

Step 6: Enabling Completion Tracking (Optional):

14. Enable Completion Tracking: If desired, set up completion tracking for activities and resources. This allows you to monitor learners' progress through the course.

Step 7: Save and Preview:

15. Save Changes: After configuring your course, ensure to save your changes.
16. Preview Course: Before making the course available to learners, preview it to ensure everything looks and functions as intended.

Step 8: Making Course Available:

17. Set Course Availability: Once satisfied with your course setup, set it to "Available" or "Visible" to allow learners to access it.

Step 9: Announcements and Communication:

18. Use Announcements: Utilize the announcement feature to communicate important updates, changes, or information to your learners.

Step 10: Continuous Monitoring and Updating:

19. Monitor Learner Progress: Regularly check learner progress, participation, and engagement. Use analytics and reports available in Moodle.

20. Update Content: Update course content as needed based on feedback, changes in curriculum, or updates in the field. By following these steps, you can create a well-structured and engaging online course in Moodle. Moodle's flexibility allows you to tailor the course to your specific educational objectives and audience.

Publish the Course in Moodle:

1. Log in to Moodle: Start by logging in to your Moodle account using your administrator or teacher credentials.
2. Navigate to the Course: Access the "Courses" section or the Moodle dashboard, and locate the specific course you want to publish.
3. Enter Course Settings: Click on the course name to enter the course and access its settings.
4. Turn Editing On: To make changes to the course, ensure that the editing mode is turned on. Look for an "Edit" or "Turn editing on" button. Click on it to enable editing.
5. Adjust Visibility Settings: Locate the visibility settings for the course. This is often represented by an eye icon. If the eye icon is closed (indicating the course is hidden), click on it to open it (make it visible).
6. Set Availability: Some Moodle installations may have additional settings related to course availability. Ensure that the course is set to be available and accessible to students.
7. Save Changes: After adjusting the visibility and availability settings, save the changes. Look for a "Save changes" or "Update" button on the page. This step is crucial to apply the modifications.
8. Turn Editing Off: If you turned editing on, remember to turn it off after saving changes. This is typically done by clicking the "Turn editing off" button.
9. Confirm Visibility: Navigate back to the course page or the main course listing. Confirm that the course is now visible. Students should be able to see the course on their dashboard or course listings.

YELLOW MARKED IN SOURCE | Unit 4 | Long answer | Source page(s): 32

Q25. Explain the steps to create a website using WordPress. (6)

Creating a website using WordPress:

1. Choose Domain and Hosting: Pick a domain name and choose a reliable hosting provider.
2. Install WordPress: Follow your hosting provider's instructions to install WordPress.
3. Choose a Theme: Select a WordPress theme that suits your website's style.
4. Customize Your Site: Use the WordPress Customizer to set up your site's identity, colors, fonts, and menus.
5. Add Essential Plugins: Install plugins for SEO, spam protection, and other essential features.
6. Create Content: Add pages, posts, and content using the Gutenberg editor.
7. Configure Settings: Adjust general and permalink settings in the WordPress dashboard.
8. Optimize for SEO: Install the Yoast SEO plugin and optimize your content for search engines.
9. Test Your Site: Preview your site, test responsiveness, and ensure everything looks and works as intended.
10. Launch Your Website: Remove any "Under Construction" pages, promote your site, and make it publicly accessible. Regularly update your content and keep themes and plugins up to date for optimal performance and security.

Extra Important Questions And Answers

Unit 1

EXTRA IMPORTANT | Unit 1 | Long answer | Source page(s): 19-20

Q14. Explain steps involved in the audio editing process.(4)

There are four main steps involved in the basics of audio editing:

- Selection
 - Editing
 - Processing
- Output Selection is the first step in audio editing. This is where you identify the portion of the audio that you want to edit, and it can be done manually or with the help of software tools. Next is Editing, where you make changes to the selected audio. Again, many different techniques can be used here, and the exact method will depend on the software being used. Processing is the third step, where you add effects or make other changes to the processed audio. Several different plugins or software programs can be used for this. Most audio processing programs will offer a suite of tools to help you get the sound you need. These can include EQ, compression, limiting, reverb, and delay. There are many different ways to process audio, so it's important to find a program that offers the specific tools required for your project. Output, where you save the edited audio file. The most common audio formats are WAV and MP3, but there are many others. WAV files are uncompressed and will take up more space than MP3 files. They are best suited for applications where sound quality is paramount, such as music editing or DVD authoring. MP3 files are compressed and will take up less space than WAV files. They are ideal for applications where file size is crucial, such as streaming audio or portable devices.

EXTRA IMPORTANT | Unit 1 | Long answer | Source page(s): 10-14

Q9. Explain various audio file formats.(4/6)

CONTENT FORMATS: These are the ways you present your content to your audience, based on its medium, style, or layout. For example, you might have content formats such as text, video, audio, image, infographic, or carousel.

Text File Formats: Plain text files usually have the extension '.txt'. They are also called ASCII text files and can be viewed with an editor (such as Edit or Notepad) or with a Word Processor (such as MS Word or Word Perfect). ASCII stands for American Standard Code for Information Interchange. It was used for character representation in computers. However, the ASCII has now been replaced by Unicode. The characteristic feature of plain '.txt' files is that they do not allow any kind of formatting on the document (such as bold, italics, font colour, images, etc).

- .htm/.html/ files These files are also text files that deserve a special mention as they are the 'language' in which web pages are authored. 'html' stands for Hyper Text Markup Language. The code of a web page is written in plain text and is saved with the extension '.htm/.html'. The web browsers (such as Mozilla Firefox, Internet Explorer, Google Chrome, etc.) identify the file as a web page, read the code and display it on the screen as we see it with the images, colours and hyperlinks.
- .xml files XML, or eXtensible Markup Language, is a text-based format derived from SGML (Standard Generalized Markup Language). It's used for storing and exchanging data. XML is versatile and commonly used for structuring information in various web products and services, facilitating the exchange of formatted documents between different systems.
- .doc files A very common format found on PCs, for formatted text files, '.doc' stands for document files. These files may be created, viewed and edited using programs such as MS Word. Several formatting features such as bold, italics, justification, bulleting, etc. are possible. It is a proprietary format of Microsoft.
- .odt files ODT stands for Open Document Text. It is part of the Open Document Format (ODF) originally developed by Sun Microsystems Inc., but now maintained by Organization for the Advancement of Structured Information Standards (OASIS). It is an XML based format. The files use '.odt' file extension. They are originally supported by Open Office and the Star Office word processor. ODT format includes several XML files and configuration files in zipped format. A zip file is a collection of many files. These files can be viewed with any archive managing software, like Winzip.

- .pdf files 'PDF' stands for Portable Document Format. This file format was developed by Adobe Systems in order to make it possible to transfer formatted documents over the Internet so that their appearance would not change on any system. The biggest advantage of .pdf files is that it allows for printing of web pages - page by page as though it is a document file. This file type requires pdf reader for viewing e.g. Adobe Acrobat, XPDF, etc. This software can be downloaded from the Internet.
- .ps files 'PS' stands for 'Post Script' files. It is also an ASCII file type that is technically plain text. However, it is unreadable unless an on-screen viewer like 'Ghostscript' or any other postscript viewer is used.

Graphic Files: Graphic file formats are many in number. Images are most important feature of web pages or any kind of publishing. It adds value as well as attracts the readers. In the Web parlance, images have to be capable of downloading quickly, they should not be bulky, though the original resolution should be preserved.

There are several Graphic file formats. Graphic styles may be divided into two major types:

- Raster Graphics

- Vector Graphics Raster Graphics: Raster Graphics/Images are collection of dots or pixels. They are also called as bitmaps. The colour of each pixel is described by one or more information 33 Collaborative Content Development channels - separated into the primary hues - Red, Green and Blue or in a Single stream of colour mapped data. Raster images are simple images and are hence most suitable for interoperability. However, the primary disadvantage is that they do not scale well. Scaling may lead to a loss of resolution and hence poorer picture quality. Vector Graphics: The more complicated of the two is Vector Graphics. They define an image as a collection of vector equations. The advantage of vector graphics is that it gives smooth curves and lines irrespective of the size of the image or resolution. However, the disadvantage is that they take longer to draw and require more storage space.

- .bmp files : Bitmap files or .bmp files are the standard Windows Raster format. These files lay emphasis on quick display. They store images in the uncompressed form. The obvious trade off is that bmp files occupy lot of space. These files are quickly downloadable but on each transfer over network the quality of picture is lost.

- .cgm files Computer Graphics Metafile (CGM) is an ANSI standard graphic file format for 2D vector graphics and raster graphics. CGM is a metafile that is a file containing information that describes or specifies another file. Therefore, it holds data and information for reconstructing graphical images. It was originally designed and used for clip art libraries, but is now mainly used for technical applications such as CAD drawings.

- .gif files One of the most popular graphic file formats on the Internet, Graphic Interchange Files (.gif) was developed by CompuServe with the main purpose of archiving information. The .gif images are usually scanned stand-alone pictures that are not 'drawn' using an application Program.

- .jpeg/.jpg files JPEG stands for Joint Photographic Experts Group that designed this format for high compression. It is one of the most popular image formats on the Web. It discards extra data and hence has good compression capabilities. It is a web standard and stores images in small size. It is useful when large numbers of files are to be incorporated and support millions of colours. It has better compression in photographs as compared to .gif

- . JAS files JAS format is from JASC Inc. This file format is designed to create the smallest possible image file for 24 bits per pixel colour images and 8 bits per pixel gray scale images. Saving and retrieving an image using the JAS file format will result in some loss of image data. It has very high level of compression.

- PICT files This is the standard Apple Macintosh graphic file format. It is accepted by many applications and imported/exported using clipboard (cut, copy, paste) to almost any text or graphics program. Raw files This flexible format consists of a stream of bytes that describes the color information in the file. Each pixel is described in binary format where 0=black and 255=white. This format is used to transfer documents between different applications.

- .tiff files TIFF stands for Tagged Image File Format. This format was designed to overcome the problem of application dependence. It was originally designed to become the standard format. The format was intended to be capable of handling just about any possibility. This file format is generally used when graphic files need to be moved between different computer types (For example: PC to Mac and viceversa). These files allow for high resolution and are supported by most scanning and image editing software. This format works well for both on-screen display and print photographs. This format differentiates among three categories of images i.e. black and white, grayscale, and colour.

Audio File Formats: Sound files or audio files are gaining popularity on the Web. Today, most of the latest soundtracks are available on the Internet as sound files. There are even a few albums that have their presence only on the Web. Another popular application is online live news broadcasting. There are audio enabled websites. The following section discusses some of the common audio file formats.

- .au files It is a simple audio file format which is most commonly found on the Web. It is required by PC users to load applications such as Waveform Hold and Modify (WHAM) to play these files. Macs need different sound applications to play

this file type.

- **.mid files** The .mid file extension is the standard extension used by MIDI music files. MIDI is a technical standard for Musical Instrument Digital Interface. These are used mostly in audio control in the multimedia industry. The MID files are used by a variety of music authoring programs and MIDI hardware devices
- **.MIDI file specification** allows for lengths to be specified as a variable number of bytes.
- **.aiff files** Audio Interchange File Format (aiff) was developed by Apple. Although it was originally made for Macs, now it can be used by other platforms too. It is a good audio file format for use on the Internet. It can also be used in multimedia authoring on both Macs and Windows.
- **.mp3** MP3 stands for MPEG layer three. It is currently the most popular audio file format. Its hallmark is its CD quality of music. MP3 allows for very high levels of collaborative content development of compression. A minute of music may constitute approximately 1 Mb file. An MP3 player, is readily available on both Macs and Windows, is required to play this file type.
- **.voc files** Creative Lab's Sound Blaster uses the .VOC file. They are designed for storing digitized voice data and hence the name. They can also handle any digitised sound in any format. The VOC files have a two part structure. The header block which defines the contents of the file and the data block which actually contains the audio information.
- **.wav** Wav file is a commonly used file format on Windows machines. It can be used on the Internet and is good for multimedia authoring. It is flexible and handles both compressed and uncompressed storage formats. Video Files Formats Video files have become most popular with films being available and viewed on VCDs and DVDs. However within a multimedia lab, it is important to be aware of the video file formats as these are the most disk space-occupying (bulky) types.
- **.avi files** Audio-Video Interleave (AVI) file format was developed by Microsoft. It is called 'Interleave' because the video and audio are bound together in chunks. The AVI file format is a very popular video file format and many videos have been produced in the format. AVI files can be opened in most of the video players such as VLC (Video LAN Client), RealPlayer, and Microsoft's Windows Media Player.
- **.mov/.movie files** Movie files are the common format used in QuickTime movies. It is a multimedia format developed by Apple. Originally, it was designed for Apple machines but now it is widely used in websites for streaming audio or video.
- **.mpg/.mpeg files** This is another standard format. This format uses MPEG compression scheme of audio and visual (AV) digital data. MPEG video is a series of video standards defined by the Moving Picture Experts Group (MPEG) [External Link](#).

Q12. Explain needs and general guidelines for content development. (4)

Needs: In the vast world of online information, both users and hosts face challenges. Users struggle to find relevant information due to its sheer volume and inconsistent presentation. Hosts aim to attract target audiences but face difficulties in organizing content effectively. Standards and guidelines have emerged to address these issues, focusing on structuring documents and presentation. Content creation for the web requires adapting to user behavior, with concise, easily scannable content. Hosts must also consider content quality, ensuring it's trustworthy and safe. Standardization is crucial for global accessibility and interoperability, enabling easy reuse of information across platforms and languages.

Some General Guidelines : When using the internet and electronic documents, people often face problems like files not working together, slow downloads, and hard-to-understand content. To make sure users get good quality, content creators should follow some basic rules. According to Jacob Neilson, a web content analyst, the content developers should take care of

the following points: i) Well-tested and widely used packages in designing web pages should be used. It is better to avoid recently released software, especially if there is use of plug-ins such as Flash or PDF. A good rule is not to use upgraded versions immediately till they mature. Software vendors require time to fix their bugs and offer reasonably reliable versions. It also gives users time to upgrade. ii) As far as possible Scripts in web pages should be avoided. Adding code means that there is also a risk of bugs (or faults). If scripts are a must, then they should be tested and debugged on all combinations of platforms and browser versions. Norms and Guidelines for Content Development 333 Content Development. iii) It is advisable to have simple point-and-click web navigation. Special menu controls often fail, especially for users who move their mouse fast or who have motor skill impairments. iv) The website should always be made as compact in size as possible. It is good to have spare server capacity so that your site can cope with traffic surges. v) Server software must be robust. When selecting vendors, ensuring code quality must be a priority.

EXTRA IMPORTANT | Unit 1 | Long answer | Source page(s): 14-15**Q10. Write a note on content tools. (4/6)**

Content Tools (Media-wise) : Content creation involves human intellect, but tools enhance efficiency in expressing ideas. Text, graphics, audio, and video are common mediums, each requiring specific tools for creation. These tools empower creators to effectively convey their thoughts and ideas to their audience in diverse and engaging formats.

Based on the form of media, tools can be categorized as:

- Text editing tools
 - Graphic editing tools
 - Audio capture and editing tools
 - Video capture and editing tools
- Text Editing Tools:** Text editors are software used in Desktop Publishing (DTP). These are editors such as MS-Office Suite, Open Office Suite and Star Office, etc. They include packages to type text and also proof read. Other than this, they also contain packages for presentation, spread sheets and database for powerful presentation, calculation, and storage and retrieval respectively. A lot of literature already exists which requires retro-conversion from print to digital. Optical Character Recognition (OCR) technology is used to convert printed text to digital. Software like Omni Page Pro, Text Bridge, Abbyy FineReader, etc. are OCR software available in the market. However, nowadays scanners come with basic OCR utility which can be used for light weight text editing.
- Graphic Editing Tools :** DTP is supplemented by effective use of graphics (images). This includes capturing the image and processing it in a presentable format. This requires use of capture devices like camera (ordinary as well as digital camera), scanners and data transfer cables. Once an image is captured it is to be converted to usable format and size. However, sometimes value addition to the image is also done by touching up the image. For the purpose, software like Adobe Photoshop, Corel Draw, etc. are widely used by professionals. However, GIMP (GNU Image Manipulation Program) is also a powerful tool to edit graphics available under Open- Source License.
- Audio Capture and Editing Tools:** Sound has more pneumatic property than text and graphics. Hence, libraries are going more and more towards recording and collecting audio materials. Audio can be recorded with a recorder which is inbuilt in Mobile phones, Dictaphones, Computers, etc. These are affordable devices used commonly in day-to-day affairs. However, there are very costly studios with various kinds of mixers and error correction devices which are also available and are used in professional recording and music. Audio Capture Card is available in the present day computers which can be used for recording. The card is connected with a Microphone which records input and feeds to the card. There are inbuilt utility software in the operating system which can be used to record and save the voice. Professional software like Authorware, WavePad, Goldwave, etc. can be used to create mixing effect.
- Video Capture and Editing Tools:** Libraries have lot of recorded presentations in their collections. The recording of any event is captured with the help of a video camera. Nowadays video camera directly record in computer readable format, therefore, there is no need to attach Video Capture Card with the computer. For editing the video there are many options available for example, CyberLink PowerDirector, Corel Video Studio ProX4, Adobe Premiere Elements, MAGIX Movie Edit Pro, VideoPad, Pinnacle 31 Collaborative Content Development Studio HD, Roxio Creator, Sony Vegas Movie Studio Platinum, Roxio Video Lab, ShowBiz DVD and many such others.

EXTRA IMPORTANT | Unit 1 | Short answer | Source page(s): 1**Q3. What are the types of content management system?**

- Component Content Management System (CCMS)
- Document Management System (DMS)
- Enterprise Content Management System (ECM)
- Web Content Management System (WCMS)
- Digital Asset Management System (DAM)

EXTRA IMPORTANT | Unit 1 | Short answer | Source page(s): 1-2**Q5. What are the types of WCMS?**

- Offline processing: This type of WCMS processes content before publishing it to the live server.
- Online processing: Online processing systems employ templates on demand and whenever the user adds content to a webpage for publication.

- Hybrid processing: Hybrid processing systems use a combination of offline and online processing.

EXTRA IMPORTANT | Unit 2 | Long answer | Source page(s): 23-24

Q18. Explain the different steps are involved in creating multilingual content in Word Press.(6)

Creating multilingual content in WordPress typically involves using a plugin like WPML (WordPress Multilingual Plugin) or Polylang. Here, I'll provide a step-by-step guide using WPML:

Step 1: Install and Activate WPML

1. In your WordPress dashboard, go to "Plugins" > "Add New."
2. Search for "WPML" and click "Install Now" next to the WPML Multilingual CMS plugin.
3. Once installed, click "Activate."

Step 2: Configure Basic Settings

1. After activation, go to the WPML menu on your dashboard.
2. Follow the setup wizard to configure the basic settings for your multilingual website. This includes choosing your site's default language and selecting additional languages.

Step 3: Translate Pages and Posts

1. Edit an existing page or post, or create a new one.
2. In the post/page editor, you'll see a new section for translations.
3. Click on the "+" button to add a translation for each language.
4. Translate the content manually or use WPML's translation services.

Step 4: Translate Media Files

1. If your content includes images or other media, ensure these files are translated or replaced with language-specific versions.
2. You can upload translated media files directly or link to external translations.

Step 5: Translate Menus and Widgets

1. Navigate to "WPML" > "Languages" > "Menu language synchronization."
2. Enable synchronization for menus. Now, you can translate your menus for different languages.
3. Translate widgets under "WPML" > "Languages" > "Widgets."

Step 6: Set Up Language Switcher

1. Go to "WPML" > "Languages."
2. Choose the language switcher options and customize its appearance.
3. Place the language switcher in your site's header, footer, or sidebar.

Step 7: SEO Considerations

1. WPML automatically adds hreflang tags to pages, helping search engines understand language targeting.
2. Review and customize SEO settings for each language using popular SEO plugins like Yoast SEO or All in One SEO Pack.

Step 8: Test and Review

1. Thoroughly test your website to ensure accurate translations and proper functionality.
2. Check for any formatting issues or discrepancies in different language versions.

Step 9: Keep Plugins Updated

1. Regularly update WPML and any other plugins to ensure compatibility and access to new features. By following these steps, you can effectively create multilingual content in WordPress using the WPML plugin. Note that the process may vary slightly if you choose a different multilingual plugin like Polylang.

EXTRA IMPORTANT | Unit 2 | Long answer | Source page(s): 18-19

Q13. Explain the key features of any three screen casting tools (6)

1. Camtasia:

Key Features:

- **Powerful Editing:** Camtasia is renowned for its advanced video editing capabilities. It provides a multi-track timeline for precise editing and enhancement of recordings.
- **Webcam Integration:** Users can seamlessly integrate webcam footage into their screencasts, allowing for a more personalized and engaging presentation.
- **Screen and Audio Recording:** Camtasia facilitates high-quality screen and audio recording, making it suitable for creating professional tutorials, presentations, and software demonstrations.
- **User-Friendly Interface:** Despite its powerful features, Camtasia maintains a userfriendly interface, making it accessible for both beginners and experienced users.

2. Snagit:

Key Features:

- **Quick Capture:** Snagit excels in quick and easy screen capture, making it a convenient tool for capturing screenshots and short video clips.
- **Image and Video Editing:** It offers robust image and video editing features, enabling users to annotate, highlight, and enhance their captures.
- **GIF Creation:** Snagit supports the creation of GIFs, providing a dynamic way to convey information in a concise and shareable format.
- **Webcam Recording:** Users can easily incorporate webcam footage into their screencasts for added engagement and communication.

3. OBS Studio (Open Broadcaster Software):

Key Features:

- **Free and Open-Source:** OBS Studio is a free and open-source screencasting tool, making it accessible to a wide range of users.
- **Live Streaming:** Apart from screencasting, OBS Studio is known for its live streaming capabilities, making it a popular choice among gamers and content creators.
- **High Customization:** It offers high customization for recording settings, allowing users to tailor the recording experience to their specific requirements.
- **Multi-Platform Support:** OBS Studio is compatible with Windows, macOS, and Linux, offering flexibility across different operating systems.

4. Loom:

Key Features:

- **Quick Video Recording and Sharing:** Loom is designed for quick video recording and sharing, making it a convenient choice for on-the-fly communication.
- **Cloud Storage for Videos:** Loom provides cloud storage for videos, allowing users to access and share their recordings easily from anywhere.
- **Annotation and Drawing Tools:** Users can annotate and draw on their screen recordings, enhancing the visual communication and emphasizing key points.

- Webcam and Screen Recording: Loom allows simultaneous webcam and screen recording, enabling a more personal and engaging communication style.

Q9. What are the different steps are involved in creating a wiki. (6)

Creating a wiki involves several key steps, from choosing a platform to setting up hosting and inviting contributors. Here's a brief overview of the process:

1. Define Purpose and Scope: Clarify why you need a wiki and what topics it will cover. Define the scope to guide content creation.
2. Choose a Wiki Platform: Select a wiki platform that suits your needs, such as MediaWiki, Confluence, or DokuWiki.
3. Set Up Hosting and Domain: Choose whether to self-host or use a cloud-based service. Set up hosting for your wiki and acquire a domain name.
4. Install and Configure: Follow the installation instructions for your chosen platform. Customize the appearance by configuring themes and visuals.
5. Create Initial Structure: Establish categories, sections, and create initial pages to structure your wiki logically.
6. Invite Contributors and Set Permissions: Define user roles and invite contributors. Set permissions for editing, administrative tasks, and moderation.
7. Encourage Collaboration: Foster a collaborative environment by encouraging users to edit, add content, and engage in discussions.
8. Implement Search Functionality: Configure search settings to ensure users can easily find relevant information.
9. Set Up Revision History: Configure settings for revision history and version control to track changes made to pages.
10. Provide Documentation and Training: Create user documentation and conduct training sessions or tutorials to guide contributors.
11. Regularly Review and Update Content: Regularly review and update content to ensure accuracy and relevance.
12. Implement Moderation and Governance: Set up moderation guidelines and mechanisms to ensure content quality. Define governance processes.
13. Gather Feedback and Iterate: Implement feedback mechanisms to gather input from users. Use feedback to make improvements and updates.

EXTRA IMPORTANT | Unit 2 | Long answer | Source page(s): 12-13

Q7. Explain the different examples of presentation software that are commonly used in conjunction with WCMS platforms. (6)

Here are examples of presentation software that are commonly used in conjunction with WCMS platforms:

1. Microsoft PowerPoint: Description: Microsoft PowerPoint is a widely used presentation software that allows users to create slideshows with various multimedia elements, transitions, and animations. Integration with WCMS: Users can design presentation slides in PowerPoint and export elements (such as images and videos) for integration into a WCMS. Presentation themes and styles can be aligned with the overall website design.
2. Google Slides: Description: Google Slides is a cloud-based presentation software that enables collaborative editing and sharing. It is part of the Google Workspace suite. Integration with WCMS: Google Slides allows teams to collaborate on presentations in real-time. Content and design elements can be integrated into a WCMS, providing a dynamic and collaborative approach to web content creation.
3. Apple Keynote: Description: Keynote is Apple's presentation software known for its sleek design tools and animations. It is commonly used in the Apple ecosystem. Integration with WCMS: Design elements created in Keynote, such as custom themes, slide layouts, and interactive features, can be exported and integrated into a WCMS for a visually appealing website.

4. Prezi: Description: Prezi is a presentation software that offers a unique zooming interface, allowing for non-linear storytelling and dynamic presentations. Integration with WCMS: Prezi presentations can be embedded into WCMS platforms to create engaging and interactive content. This adds a layer of visual interest to web pages.
5. Canva: Description: While Canva is primarily a graphic design tool, it also offers presentation templates and features for creating visually stunning slides. Integration with WCMS: Canva designs can be exported and integrated into a WCMS, providing a user-friendly approach for creating visually appealing content without extensive design skills.
6. Adobe Spark: Description: Adobe Spark is a suite of design tools that includes Spark Video for creating presentations with animated elements. Integration with WCMS: Spark Video presentations can be exported or embedded into a WCMS, allowing for the inclusion of multimedia content and animations on web pages.
7. Haiku Deck: Description: Haiku Deck is a presentation tool known for its simplicity and focus on visual storytelling. It offers a library of high-quality images for users. Integration with WCMS: Haiku Deck presentations can be embedded into WCMS platforms to enhance visual storytelling on websites.
8. Slider Revolution: Description: Slider Revolution is a plugin for creating responsive sliders, carousels, and dynamic content within websites. Integration with WCMS: While not a traditional presentation software, Slider Revolution is often used within WCMS platforms to create dynamic and visually appealing sliders on the homepage or other sections of a website. When integrating presentation software with a WCMS, it's essential to consider factors such as responsiveness, collaborative features, and the ability to export or embed content seamlessly. Each of these presentation tools brings its unique features and capabilities to the table, allowing content creators to enhance the visual presentation of their web content.

EXTRA IMPORTANT | Unit 2 | Long answer | Source page(s): 22-23

Q17. Write and explain steps involved in developing multilingual content.

Developing multilingual content: Select a Multilingual CMS: Choose a Content Management System that supports multilingual capabilities. Popular CMS options like WordPress, Drupal, and Joomla have plugins or built-in features for managing content in multiple languages. Content Organization: Plan a clear content structure, considering language-specific categories and tags. This helps in organizing and managing multilingual content effectively. Translate Content: Create high-quality translations for each piece of content. You can hire professional translators or use translation tools, but ensure that translations are accurate and culturally relevant. URL Structure: Implement a URL structure that reflects language variations. This could involve using language codes or subdomains to distinguish between different language versions of your site. Hreflang Tags: Incorporate hreflang tags in your HTML to inform search engines about the language and regional targeting of each page. This helps search engines deliver the correct language version to users. Language Switcher: Include a user-friendly language switcher on your website, allowing visitors to easily switch between languages. This can be in the form of a dropdown menu or flags representing different languages. Localized Metadata: Customize metadata (title tags, meta descriptions) for each language version to optimize search engine results for specific regions and languages. Responsive Design: Ensure your website has a responsive design that adapts well to various devices and screen sizes, considering the diverse audience accessing your content. Testing: Thoroughly test all language versions of your website. Check for functionality, design consistency, and language accuracy. Pay attention to how different languages display on various devices. Regular Updates: Keep all language versions up to date simultaneously. Regularly update content, announcements, and any changes across all language variations to maintain consistency. User Feedback: Encourage user feedback on language-specific content to identify any issues or areas for improvement. This helps in refining the multilingual user experience. Analytics Monitoring: Use analytics tools to monitor the performance of each language version. Analyse user behaviour, engagement, and conversions to refine your multilingual content strategy. By following these steps, you can establish a robust framework for multilingual content development, ensuring a seamless and engaging experience for your diverse audience.

EXTRA IMPORTANT | Unit 2 | Long answer | Source page(s): 17-18

Q12. Explain about advanced features and best practices in presentation software. (6)

Advanced Features and Best Practices In presentation software:

1. Advanced Design Features:
 - Custom Templates: Create personalized designs for branding consistency.
 - Master Slides: Establish uniform formatting across all slides.

- Custom Fonts and Colors: Tailor the presentation to match branding guidelines.
 - Object Alignment and Distribution: Ensure precise arrangement of elements on slides.
 - Grid and Guides: Use visual aids to maintain alignment and spacing.
 - Backgrounds and Themes: Enhance visual appeal with thematic backgrounds.
2. Interactive Elements:
- Hyperlinks: Navigate to external resources or other slides within the presentation.
 - Action Buttons: Enable interactive navigation within the presentation.
 - Forms and Surveys: Integrate feedback mechanisms directly into the presentation.
 - Quizzes and Polls: Engage the audience with interactive quizzes or polls.
3. Collaboration and Sharing:
- Cloud Integration: Share presentations online for collaborative editing.
 - Version Control: Track changes and revisions made by multiple collaborators.
 - Commenting and Feedback: Provide and receive feedback within the presentation software.
 - Export and Sharing Options: Export presentations in various formats for sharing or printing.
4. Advanced Animation and Transition Techniques:
- Custom Animations: Create custom animation sequences for specific effects.
 - Motion Paths: Define the movement trajectory of objects on slides.
 - Timing and Triggers: Control the timing and activation of animations.
 - Advanced Transitions: Explore advanced transition effects for added visual interest
5. Accessibility and Inclusivity:
- Alternative Text: Provide alternative text descriptions for images and visual content.
 - Readability: Ensure text is legible and accessible to all audience members.
 - Closed Captioning: Include captions for audio and video content to support hearing-impaired individuals.

Unit 3

EXTRA IMPORTANT | Unit 3 | Long answer | Source page(s): 10

Q7. Give detailed steps to create website using CSS. (6)

1. HTML Structure:
 - Create an HTML file with the basic structure of your webpage.
 - Include elements like <header>, <nav>, <section>, and <footer>.
2. CSS Styling:
 - Create a separate CSS file and link it to your HTML file.
 - Style your webpage elements using selectors like body, header, nav, etc.
3. Basic Styling: Apply basic styling to elements, such as setting font styles, background colors, and spacing.
4. Content and Links:
 - Replace placeholder content in your HTML file with your actual text.
 - Create navigation links using <a> tags.
5. Preview:
 - Open your HTML file in a web browser to preview your website.

- Make adjustments to HTML and CSS as needed.

6. Optional Enhancements:

- Add JavaScript for interactivity (optional).
- Implement responsive design for different screen sizes.
- Consider SEO optimizations, such as meta tags.

EXTRA IMPORTANT | Unit 3 | Long answer | Source page(s): 9

Q6. Explain selectors in CSS. (4)

Selectors in CSS (Cascading Style Sheets) are used to target HTML elements for styling. They define which part of the HTML a set of CSS rules should apply to.

Here are the main types of CSS selectors:

1. Universal Selector:

- Selects all elements on a page.

2. Type Selector: h1, p, div - Selects elements based on their tag name.

3. Class Selector: .classname - Selects elements with a specific class attribute.

4. ID Selector: #id - Selects a single element with a specific ID attribute.

5. Attribute Selector: [attribute=value] - Selects elements based on the presence or value of a specific attribute.

6. Descendant Selector: ancestor descendant - Selects all descendants of a given ancestor.

7. Child Selector: parent > child - Selects all direct children of a parent element.

8. Adjacent Sibling Selector: element + element - Selects an element that is immediately preceded by a specified sibling element.

EXTRA IMPORTANT | Unit 3 | Long answer | Source page(s): 6

Q2. Explain the characteristics of static websites. (4/6)

1. Fixed Content:

- Content on static websites is constant and does not change automatically.
- Any modifications or updates to the content require manual editing of the HTML files.

2. Simplicity:

- Static websites are typically simpler to create and maintain, making them suitable for smaller websites or those with minimal content.

3. Ease of Hosting:

- Static websites can be hosted on simple web servers without the need for complex server-side technologies.
- They are often hosted on platforms that specialize in serving static content.

4. Page Loading Speed:

- Static websites generally load faster than dynamic websites since the content is pre-built and doesn't require server-side processing for each user request.

5. Security:

- Due to their simplicity, static websites can be considered more secure as there are fewer vulnerabilities associated with server-side scripting or database interactions.

6. Cost-Effectiveness:

- Static websites are cost-effective to host and maintain because they don't require server-side processing or database management.

7. Limited Interactivity:

- Interactivity on static websites is limited to hyperlinks and basic HTML forms.
- Features like user accounts, dynamic forms, or personalized content are not inherent in static websites.

8. Examples:

- Brochure websites, where the goal is to provide information about a business or organization.
- Personal portfolios or resume websites.
- Landing pages for marketing campaigns with fixed content.

EXTRA IMPORTANT | Unit 3 | Long answer | Source page(s): 10-11

Q8. Write a note on the purposes for which blogs are used. (4/6)

1. Content Sharing: Blogs are platforms for sharing information, ideas, and knowledge on specific topics. Bloggers often publish articles, guides, and tutorials to educate and inform their audience.
2. Personal Expression: Many individuals use blogs as a means of personal expression. They share their thoughts, experiences, and perspectives on a wide range of topics, from travel and lifestyle to personal development and creative pursuits.
3. Business Marketing: Blogs are valuable tools for businesses to promote their products or services. They can publish content that highlights their expertise, industry insights, and solutions, building trust with potential customers.
4. Search Engine Optimization (SEO): Regularly updated blogs can improve a website's SEO. Search engines favor fresh and relevant content, and blogs provide an opportunity to incorporate keywords, driving organic traffic to the site.
5. Community Building: Blogs facilitate interaction and engagement with readers through comments and social media. A community can form around a blog, creating a space for discussions and shared interests.
6. Thought Leadership: Professionals and experts in various fields use blogs to establish themselves as thought leaders. By sharing insights, research findings, and expert opinions, they can influence their industry and gain credibility.
7. Monetization: Bloggers can monetize their blogs through various means, such as advertising, sponsored content, affiliate marketing, or even selling their own products or services.
8. Education and How-To Guides: Blogs are often used to provide educational content and step-by-step guides. This could include tutorials, DIY projects, or in-depth explanations of complex topics.

Q22. Write the steps to customize blogs.

Select a Theme: Choose a visually appealing and responsive theme for your blog. Most platforms offer a variety of free and premium themes.

Customize Design Elements: Personalize your blog by customizing colors, fonts, and layout. Make sure your design aligns with your blog's theme and target audience.

Unit 4

EXTRA IMPORTANT | Unit 4 | Long answer | Source page(s): 34-36

Q28. Differentiate between Joomla and Drupal. (4/6)

Joomla and Drupal are both popular open-source content management systems (CMS) that enable users to build and manage websites. However, they have differences in terms of their architecture, ease of use, flexibility, and community support.

Here are some key differences between Joomla and Drupal:

1. Ease of Use:

Joomla: Generally considered more user-friendly and easier for beginners. Has a more intuitive interface and a simpler learning curve. Offers a more straightforward content creation and management process.

Drupal: Often perceived as having a steeper learning curve. Provides a more powerful and flexible system but may be more complex for new users. Offers a higher level of customization but might require more technical expertise.

2. Flexibility:

Joomla: Known for striking a balance between flexibility and ease of use. Suitable for a wide range of websites, from small to medium-sized businesses and community sites.

Drupal: Offers a high level of flexibility and customization. Particularly well-suited for complex and large-scale websites, including enterprise-level applications.

3. Architecture:

Joomla: Follows a modular architecture, allowing users to extend functionality using extensions. Extensions in Joomla include components, modules, and plugins.

Drupal: Follows a modular architecture similar to Joomla but with a more granular approach. Modules in Drupal can be more finely tuned and customized to suit specific needs.

4. Community and Support:

Joomla: Has a large and active community, providing a good level of support and a range of extensions. Documentation and community forums are available for assistance.

Drupal: Known for a robust and active community that contributes to ongoing development. Offers extensive documentation, forums, and resources for developers.

5. Target Audience:

Joomla: Often chosen for small to medium-sized websites, community portals, and e-commerce sites. Suitable for users with moderate technical knowledge.

Drupal: Preferred for larger and more complex websites, including enterprise-level applications. Attracts users with a higher level of technical expertise who require extensive customization.

6. Themes and Templates:

Joomla: Provides a variety of templates and themes for customization. Themes are often more visually oriented and easier to implement.

Drupal: Offers a range of themes with a focus on functionality and customization. Themes may require more technical expertise for implementation.

7. Security:

Joomla: Has a good security track record. Security measures include regular updates and extensions to enhance website protection.

Drupal: Known for its strong emphasis on security. Regular security updates and a dedicated security team contribute to Drupal's reputation for robust security.

Q19. Explain the steps involved in Add a Quiz (Assessment) in Moodle (6)

Adding an assessment in Moodle involves creating an activity within your course. Assessments can include quizzes, assignments, and other evaluative tasks. Here's a

step-by-step guide on how to add a quiz as an assessment in Moodle:

Add a Quiz (Assessment) in Moodle:

1. Log in to Moodle: Access your Moodle account using your administrator or teacher credentials.
2. Navigate to the Course: Locate and enter the specific course where you want to add the assessment.
3. Turn Editing On: Ensure that editing mode is turned on. Look for an "Edit" or "Turn editing on" button and click on it.
4. Choose Section: Navigate to the section of the course where you want to add the assessment. It could be a week or topic section.
5. Add an Activity or Resource: Click on the "Add an activity or resource" link within the chosen section.
6. Select Quiz: From the list of available activities, choose "Quiz" and click on "Add."
7. Configure Quiz Settings: Fill in the details for the quiz, including the name, description, and other settings. You can set the time limit, number of attempts, and grading options
8. Add Questions: After configuring general settings, add questions to the quiz. You can create various question types, including multiple-choice, true/false, short answer, etc.
9. Save Changes: Once questions are added, save the changes. You may need to click on a "Save" or "Update" button.
10. Preview Quiz: Consider previewing the quiz to ensure that questions are displayed correctly and that the assessment functions as intended.
11. Set Quiz Availability: Set availability options, including open and close dates for the quiz, if applicable.
12. Save and Display: Save your quiz settings. You'll typically have an option to either "Save and return to course" or "Save and display." Choose the one that fits your workflow.

Additional Tips:

Advanced Quiz Settings: Explore advanced settings for more customization, such as shuffle questions, review options, and feedback settings.

Grading Methods: Familiarize yourself with grading methods available in Moodle quizzes, such as highest grade, average grade, or the first attempt.

Question Banks: Utilize Moodle's question bank feature to organize and reuse questions across multiple assessments.

Question Categories: Group questions into categories within the question bank for better organization and management.

User Restrictions: Consider setting user restrictions if you want to limit quiz access based on specific criteria, such as completion of other activities or a minimum grade.

Q23. Explain the steps involved to build website using Joomla. (6)

Building a website using Joomla involves several steps, from setting up the necessary environment to designing and populating your site with content.

Here's a basic guide to help you get started:

Step 1: Choose a Domain and Hosting

1. Domain Name: Choose and register a domain name for your website. This is the address that users will use to access your site (e.g., www.yourwebsite.com).
2. Web Hosting: Choose a reliable web hosting provider that supports Joomla. Many hosting providers offer one-click installations for Joomla.

Step 2: Install Joomla

1. Download Joomla: Visit the official Joomla website (<https://downloads.joomla.org/>) and download the latest version of Joomla.
2. Upload to Server: Upload the Joomla files to your web server using FTP or through your hosting provider's file manager.
3. Create a Database: Create a MySQL database and user through your hosting provider's control panel. Make sure to note down the database details.

4. Run Installation: Access your website through a web browser. The Joomla installation process will guide you through setting up your site. Enter the database details and configure basic settings.

Step 3: Configure Joomla

1. Administrator Login: After installation, log in to the Joomla Administrator Dashboard using the credentials you provided during installation.
2. Configure Global Settings: Set up global configuration settings, including site name, description, time zone, and other preferences.

Step 4: Choose a Template

1. Select a Template: Choose a Joomla template for your site. Templates control the look and feel of your website.
2. Install the Template: Install the selected template through the Joomla Administrator Dashboard. You can also customize the template settings to match your preferences.

Step 5: Add Content

1. Create Categories and Articles: Organize your content by creating categories and articles. Articles can include text, images, and multimedia.
2. Menus and Navigation: Create menus to structure your site's navigation. Add menu items that link to categories, articles, or other content.

Step 6: Install Extensions

1. Extensions Marketplace: Explore the Joomla Extensions Directory (<https://extensions.joomla.org/>) to find and install extensions that add functionality to your site (e.g., contact forms, galleries, SEO tools).
2. Install and Configure Extensions: Install extensions through the Joomla Administrator Dashboard and configure their settings.

Step 7: Test and Launch

1. Preview and Test: Preview your website to ensure everything looks and functions as expected. Test different devices and browsers.
2. Launch Your Website: Once you are satisfied with the website's appearance and functionality, you can officially launch it for public access.

Step 8: Regular Maintenance

1. Backups: Regularly back up your Joomla site to prevent data loss in case of issues.
2. Updates: Keep Joomla, templates, and extensions up to date to benefit from the latest features and security patches.

Q15. Explain any six key features of Moodle. (6)

Key features of Moodle include:

1. Course Management: Moodle allows educators to organize course content, create assignments, and manage assessments in a centralized online platform.
2. Collaboration Tools: The platform provides tools for communication and collaboration, including discussion forums, chat rooms, and messaging, fostering interaction among students and instructors.
3. Content Creation: Educators can create and upload various types of content, including text, multimedia, documents, and links, making course materials easily accessible to students.
4. Assessment and Grading: Moodle supports various assessment methods, such as quizzes, assignments, and forums. Instructors can grade assignments, provide feedback, and track student progress.
5. Customization: The platform is highly customizable, allowing institutions and instructors to tailor the appearance and functionality of their Moodle sites to meet specific educational needs.
6. Open Source: Being open-source, Moodle is freely available for anyone to download, use, modify, and distribute. This fosters a global community of developers and educators contributing to its improvement.

7. Scalability: Moodle is scalable and suitable for both small-scale educational environments, such as individual classrooms, and large-scale institutions or organizations with a vast number of users.
8. Security and Privacy: Moodle emphasizes security and privacy features to protect user data and ensure a safe online learning environment.
9. Integration: Moodle supports integration with other educational technologies and systems, such as Learning Tools Interoperability (LTI) tools, authentication systems, and third-party plugins.
10. Mobile Accessibility: Moodle provides mobile apps for iOS and Android devices, enabling users to access course materials and participate in activities on the go.
11. Community Support: The Moodle community is active and engaged, providing forums, documentation, and resources for educators, administrators, and developers.

Q13. Write the steps to create 3D animations using Blender (6)

Creating 3D animations using Blender involves several steps, from modeling and texturing to animation and rendering. Here's a basic guide on how to create a simple 3D animation using

Blender:

1. Download and Install Blender:

- Visit the official Blender website (<https://www.blender.org/download/>) to download the latest version of Blender.
- Install Blender on your computer following the installation instructions for your operating system.

2. Open Blender:

- Launch Blender.

3. Familiarize Yourself with the Interface:

- Blender has a comprehensive interface with multiple panels. Familiarize yourself with the 3D Viewport, Outliner, Properties panel, Timeline, and other key components.

4. Create or Import 3D Models:

- You can either create 3D models within Blender or import existing models.
- To create a simple object, use the "Add" menu in the 3D Viewport or use keyboard shortcuts (Shift + A) to add primitives like cubes, spheres, or cylinders.

5. Modeling:

- Use Blender's modeling tools to shape and modify your 3D objects.
- Switch between Edit Mode and Object Mode to edit vertices, edges, and faces.

6. Texturing:

- Add materials and textures to your models for realistic appearances.
- Open the "Shading" workspace to work with materials and textures.

7. Lighting:

- Set up lighting for your scene using the "Lighting" workspace.
- Experiment with different types of lights, such as point lights, spotlights, and area lights.

8. Animation:

- Switch to the "Animation" workspace to start animating.
- Select an object, go to the Timeline, and set keyframes to define its position, rotation, and scale at different points in time.
- Use the Dope Sheet and Graph Editor for more detailed animation control.

9. Adding Cameras:

- Add a camera to your scene to define the viewpoint for rendering.
- Animate the camera's position and rotation for dynamic shots.

10. Rendering:

- Set up rendering settings in the "Output Properties" panel.
- Choose a file format (e.g., PNG, JPEG) and specify the output location.
- Press the "Render" button to render your animation.

11. Previewing Your Animation:

- Use the "Animation" workspace to preview your animation before rendering the final output.
- Adjust animation timing and make any necessary refinements.

12. Saving Your Project:

- Periodically save your Blender project using the "File" menu.
- Blender uses its project file format (.blend).

13. Exporting Your Animation:

- Once satisfied with your animation, export it to a video format.
- Use the "File" menu and choose "Export" to select a suitable video format (e.g., MP4).

14. Share Your Animation:

- Your 3D animation is now ready to be shared with others or incorporated into other projects.

15. Explore Advanced Features:

- Blender offers numerous advanced features, including particle systems, simulations, and scripting. As you become more experienced, explore these features to enhance your animations. Blender has a steep learning curve, but it's a powerful and versatile tool for 3D modeling and animation. There are numerous tutorials available online to help you delve deeper into specific aspects of Blender's capabilities.

Q29. Write the Steps to create website using Drupal. (6)

Creating a website using Drupal involves several steps, from setting up the environment to configuring the site and adding content.

Here's a step-by-step guide to help you create a basic website with Drupal:

Step 1: Set Up Your Environment

1. Choose a Hosting Provider: Select a hosting provider that supports Drupal. Popular options include Acquia, Pantheon, and various other hosting providers that meet Drupal's requirements.
2. Install Drupal: Many hosting providers offer one-click installations for Drupal. Follow the provider-specific instructions to install Drupal on your server. If you're using your local machine for development, you can use tools like Acquia Dev Desktop or MAMP.

Step 2: Configure Basic Site Settings

1. Access the Drupal Admin Dashboard: After installation, log in to the Drupal admin dashboard using the credentials you created during the installation process.
2. Configure Site Information: Navigate to "Configuration" > "Site Information" to set basic site details like the site name and email address.

Step 3: Choose and Install a Theme

1. Navigate to Appearance: In the admin dashboard, go to "Appearance" to manage themes.
2. Install a Theme: Click on the "Install new theme" button and choose a theme from the Drupal repository or upload a custom theme.

3. Enable and Set Default Theme: Once installed, enable the theme and set it as the default.

Step 4: Extend Functionality with Modules

1. Navigate to Extend: In the admin dashboard, go to "Extend" to manage modules.
2. Install Modules: Browse and install modules based on the functionality you need. Common modules include Pathauto for URL aliases, Views for creating custom content displays, and Token for placeholder tokens.

Step 5: Create Content Types and Fields

1. Content Types: Define custom content types for your site's content. Navigate to "Structure" > "Content types" and click "Add content type."
2. Add Fields: Add fields to your content types for different types of content (text, image, date, etc.).

Step 6: Configure Menus and Navigation

1. Create Menus: Navigate to "Structure" > "Menus" to create menus for your site.
2. Add Menu Items: Add menu items and organize them according to your site's structure.

Step 7: Configure User Roles and Permissions

1. Navigate to People: Go to "People" to manage user roles and permissions.
2. Configure Roles: Create custom roles and assign appropriate permissions to each role.

Step 8: Customize Site Appearance

1. Navigate to Appearance: Customize your site's appearance by adjusting theme settings. Go to "Appearance" and click on the settings for your chosen theme.

Step 9: Create and Manage Content

1. Create Content: Start adding content to your site by navigating to "Content" > "Add content."
2. Use Views: Use the Views module to create customized displays of your content.

Step 10: Test and Launch

1. Test Your Site: Thoroughly test your site to ensure everything works as expected.
2. Launch Your Site: Once satisfied with the configuration and content, your site is ready to launch.

Additional Tips:

- Backup Your Site:** Regularly backup your site, especially before making significant changes or updates.
- Keep Modules and Themes Updated:** Regularly update Drupal core, modules, and themes to ensure security and stability.
- Explore Documentation and Community:** Refer to Drupal's documentation and engage with the Drupal community for support and best practices.
